1 Introduction

1.1 Purpose

Spoiler Alert is an application that helps families and individuals avoid consuming recalled products as well as keep track of already purchased products. The website is made for both computers and mobile devices.

1.2 Scope

Spoiler Alert's prototype aims to make the general public aware of recalls as they happen. The prototype will have all the main features that make it functional such as the ability to filter medical needs like allergies, log purchased products, and receive email notifications based on these two.

1.3 Definitions, Acronyms, and Abbreviations

- Product Recall: When a manufacturer notifies the market of a product with a defect or potential danger.
- FDA: Food and Drug Administration
- CDC: Centers for Disease Control and Prevention
- UPC: Universal Product Code
- USDA: U.S. Department of Agriculture
- CPSC: U.S. Consumer Product Safety Comision

- openFDA API: The way SpoilerAlert is accessing FDA Data.
- Barcode Lookup API: The way SPOilerAlert is accessing FDA Data.

1.5 Overview

The rest of this product specification sheet will detail the hardware and software specifications as well as the user expectations.

2 Overall Description

Spoiler Alert's prototype is a web-application that uses an SQL Lite database. It allows users to receive custom notifications about recalls and is designed for users concerned with their eating habits or their family's food. This prototype will not include barcode scanning, but the real world product might.

2.1 Product Perspective

Spoiler Alert is an FDA based recall notification application. Hosted as a web-application and accessible through a browser Spoiler Alert utilizes a server and SQL database to store product and user information used to filter what alerts a user should receive. This is mainly done

with the product's Barcode and the FDA's recall database to reference them.

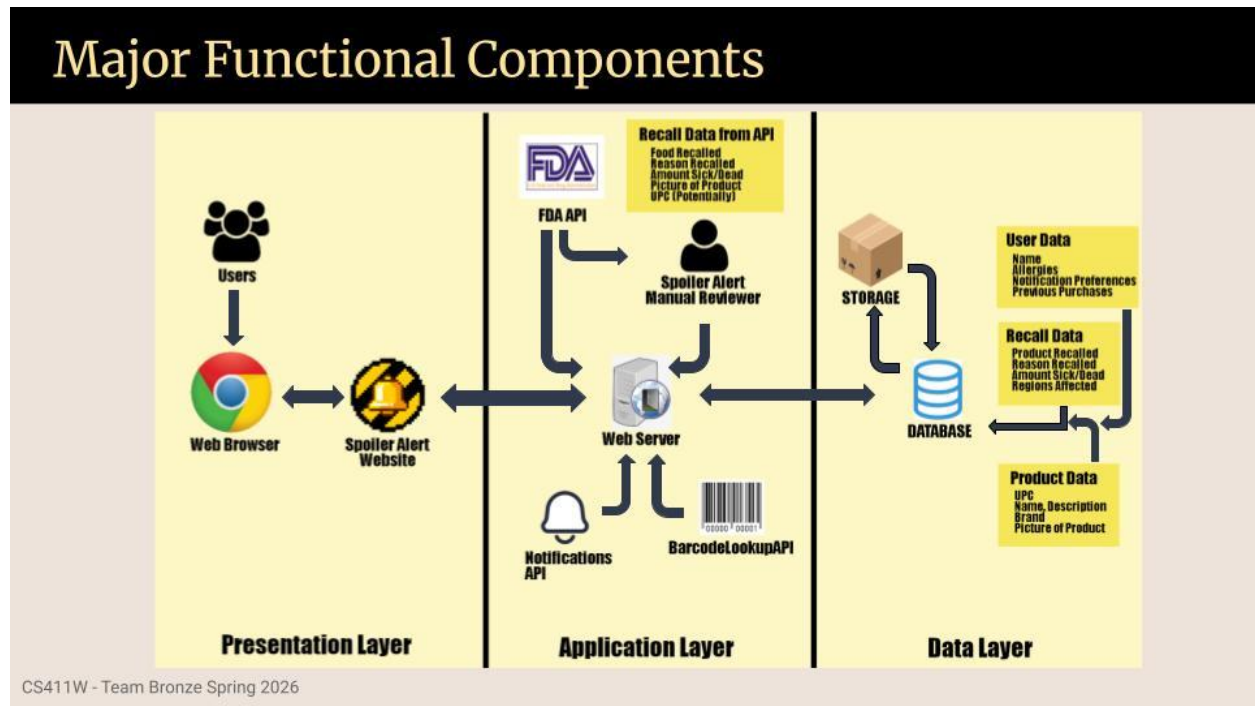

Figure 1 Major Functional Component Diagram (MFCD)

2.2 Product Functions

The main features of Spoiler Alert include the ability to log purchased products as well as create filters saved to a user profile on the database. Every week when the FDA updates their list of recalls, any new recalls that fit a user's filters or logged products will trigger an email notification to the user. The web-application will not allow for the scanning of barcodes using cameras or forwarding of notifications using phone messaging.

2.3 User Characteristics

There are currently two user roles: General User and Employee User. General Users are expected to know how to navigate a basic website layout with a navigation bar as well as know

their medical needs as they are related to food recalls. Employee Users are expected to be able to be capable of using the employee panel to verify products and enter missing information needed.

2.4 Constraints

One known issue is the usage of Barcode Lookup API is being done through a free trial and may not be utilized in the future due to the cost of the API. However, for the purposes of the prototype we will use it while we find an alternative.

2.5 Assumptions and Dependencies

The prototype will be using the FDA's FDA API to access recall records out of their database which means all information provided using Spoiler Alert will be official. Spoiler Alert will also utilize Barcode Lookup API to input and find products.
